

## LSM6DSOX and ISM330DHC 6 DoF IMU

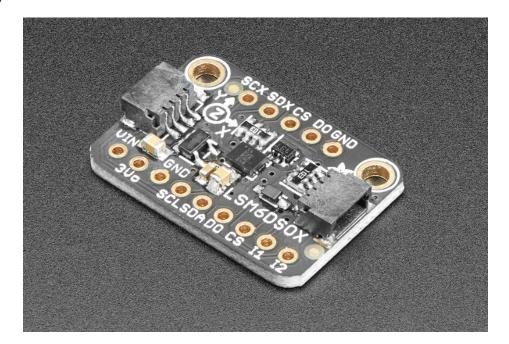

Created by Bryan Siepert

Last updated on 2020-04-10 01:25:41 PM EDT

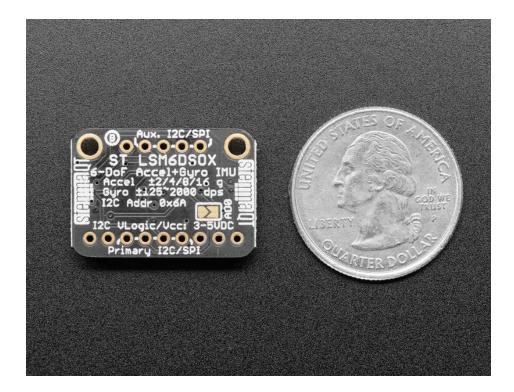

#### Overview

Behold, the ST LSM6DSOX: The latest in a long line of quality Accelerometer+Gyroscope 6-DOF IMUs from ST. Along with the LSM6DSOX, this guide will cover the *industrial* version, the ISM330DHCX. Both are pin-compatible and are nearly code-compatible - we'll be using the same library code and wiring diagrams to connect to both

In the ISM330DHCX the sensing elements of the accelerometer and of the gyroscope are implemented on the same silicon die, thus guaranteeing superior stability and robustness. It also has an extended temperature range of -40 to +105 °C compared to the LSM6DSOX's -40 to +85 °C. Finally, the ISM330's gyroscope can measure up to  $\pm$ 4000 dps, the LSM6DSOX tops out at  $\pm$ 2000 dps. If those extras aren't essential for your needs, the LSM6DSOX will do quite nicely.

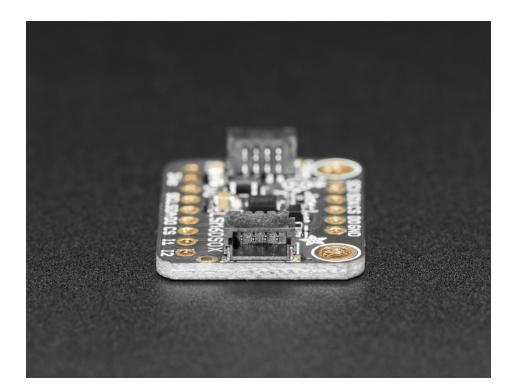

Both sensors are great IMU sensors with 6 degrees of freedom - 3 degrees each of linear acceleration and angular velocity at varying rates within a respectable range.

For the accelerometer:  $\pm 2/\pm 4/\pm 8/\pm 16$  g at 1.6 Hz to 6.7KHz update rate. For the gyroscope:  $\pm 125/\pm 250/\pm 500/\pm 1000/\pm 2000$  dps (plus  $\pm 4000$  dps for the ISM330) at 12.5 Hz to 6.7 KHz. There's also some nice extras, such as built in tap detection, activity detection, pedometer/step counter and a programmable finite state machine / machine learning core that can perform some basic gesture recognition.

For interfacing, you can use either SPI or I2C - there's two configurable interrupt pins. For advanced usage, you can attach additional devices to an external I2C/SPI port - used for optical image stabilization.

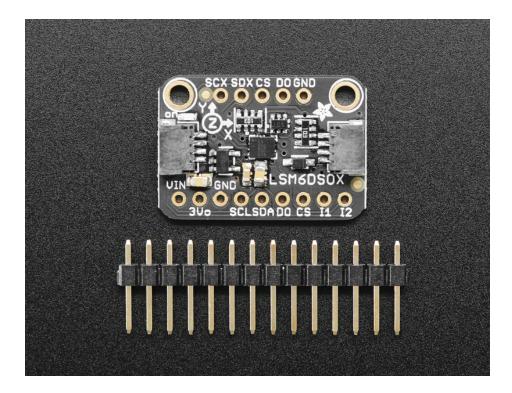

To make getting started fast and easy, we placed the sensors on compact breakout boards with voltage regulation and level-shifted inputs. That way you can use them with 3V or 5V power/logic devices without worry.

We also wrote libraries to help you get these sensors integrated with your Arduino/C++ or CircuitPython/Python boards such as Raspberry Pi or other single board computers.

Additionally since it speaks I2C you can easily connect it up with two wires (plus power and ground!). We've even included SparkFun qwiic (https://adafru.it/Fpw) compatible STEMMA QT (https://adafru.it/Ft4) connectors for the I2C bus so you don't even need to solder! Just wire up to your favorite micro with a plug-and-play cable to get 6 DoF data ASAP.

#### **Pinouts**

#### **Power Pins**

- Vin this is the power pin. Since the sensor chip uses 3 VDC, we have included a voltage regulator on board that will take 3-5VDC and safely convert it down. To power the board, give it the same power as the logic level of your microcontroller e.g. for a 5V microcontroller like Arduino, use 5V
- 3Vo this is the 3.3V output from the voltage regulator, you can grab up to 100mA from this if you like
- GND common ground for power and logic

#### **I2C Logic Pins**

- **SCL** I2C clock pin, connect to your microcontroller's I2C clock line. This pin is level shifted so you can use 3-5V logic, and there's a **10K pullup** on this pin.
- SDA -I2C data pin, connect to your microcontroller's I2C data line. This pin is level shifted so you can use 3-5V logic, and there's a 10K pullup on this pin.
- STEMMA QT (https://adafru.it/Ft4) These connectors allow you to connectors to dev boards with STEMMA QT connectors or to other things with various associated accessories (https://adafru.it/Ft6)
- Bottom Row SDO The default I2C address is 0x6A When using I2C, this pin can be tied to 3.3V to set the I2C address to 0x6B

## SPI Logic pins:

All pins going into the breakout have level shifting circuitry to make them 3-5V logic level safe. Use whatever logic level is on **Vin!** 

- SCK This is also the SPI Clock pin, it's an input to the chip
- DO this is the Serial Data Out / Master In Slave Out pin, for data sent from the LSM6DSOX or ISM330DHCX to your processor.

- SDI this is also the Serial Data In / Master Out Slave In pin, for data sent from your processor to the LSM6DSOX or ISM330DHCX
- CS this is the Chip Select pin, drop it low to start an SPI transaction. Its an input to the chip

If you want to connect multiple LSM6DSOX's or ISM330DHCX's to one microcontroller, have them share the **SDI**, **SDO** and **SCK** pins. Then assign each one a unique **CS** pin.

#### Other Pins

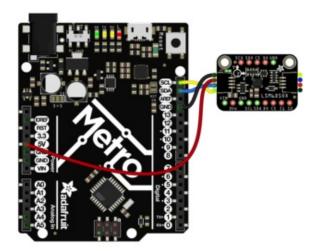

- INT1-This is the primary interrupt pin. You can setup the LSM6DSOX or ISM330DHCX to pull this low when certain conditions are met such as new measurement data being available. Consult the datasheet (https://adafru.it/HFU) for usage
- INT2 -This is the primary interrupt pin. You can setup the LSM6DSOX or ISM330DHCX to pull this low when certain conditions are met such as new measurement data being available. Consult the datasheet (https://adafru.it/HFU) for usage
- **D0** I2C Address pin. Pulling this pin high or bridging the solder jumper on the back will change the I2C address from **0x6A** to **0x6B**
- SCX, SDX, Aux CS, Aux DO Pins for advanced users to connect the LSM6DSOX or ISM330DHCX to another sensor. Consult the datasheet (https://adafru.it/HFU) for usage

#### Arduino

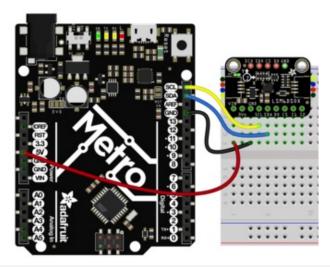

## **I2C** Wiring

Use this wiring if you want to connect via I2C interface

By default, the I2C address is 0x6A. If you add a jumper from DO to 3.3V the address will change to 0x6B

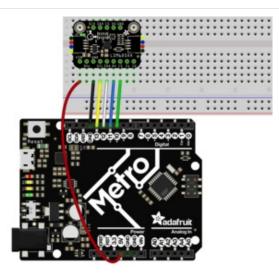

- Connect board VIN (red wire) to Arduino 5V if you are running a 5V board Arduino (Uno, etc.). If your board is 3V, connect to that instead.
- Connect board GND (black wire) to Arduino GND
- Connect board SCL (yellow wire) to Arduino SCL
- Connect board SDA (blue wire) to Arduino SDA

The final results should resemble the illustration above, showing an Adafruit Metro development board.

## SPI Wiring

Since this is a SPI-capable sensor, we can use hardware or 'software' SPI. To make wiring identical on all microcontrollers, we'll begin with 'software' SPI. The following pins should be used:

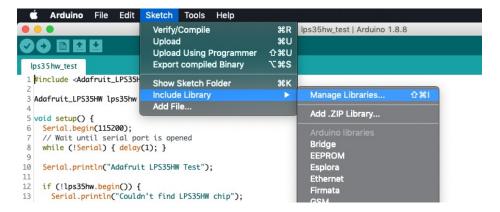

- Connect Vin to the power supply, 3V or 5V is fine.
   Use the same voltage that the microcontroller logic is based off of
- Connect GND to common power/data ground
- Connect the SCL pin to Digital #13 but any pin can be used later
- Connect the DO pin to Digital #12 but any pin can be used later
- Connect the SDA pin to Digital #11 but any pin can be used later
- Connect the CS pin Digital #10 but any pin can be used later

Later on, once we get it working, we can adjust the library to use hardware SPI if you desire, or change the pins to others.

## Library Installation

You can install the **Adafruit LSM6DS Library** for Arduino using the Library Manager in the Arduino IDE. **This will work** for the LSM6DSOX, ISM330DHCX, and LSM6DS33:

Click the Manage Libraries ... menu item, search for Adafruit LSM6DS, and select the Adafruit LSM6DS library:

Then follow the same process for the Adafruit BusIO library.

Finally follow the same process for the Adafruit Unified Sensor library:

## Load Example

Open up File -> Examples -> Adafruit LSM6DS -> adafruit\_lsm6dsox\_test and upload to your Arduino wired up to the sensor.

Depending on whether you are using I2C or SPI, change the pin names and comment or uncomment the following lines.

```
if (!lsm6dsox.begin_I2C()) {
  //if (!lsm6dsox.begin_SPI(LPS_CS)) {
  //if (!lsm6dsox.begin_SPI(LPS_CS, LPS_SCK, LPS_MISO, LPS_MOSI)) {
```

Once you upload the code, you will see the accelerometer, gyro, and temperature measurements being printed when you open the Serial Monitor (Tools->Serial Monitor) at 115200 baud, similar to this:

```
Adafruit LSM6DSOX test!
LSM6DSOX Found!
Accelerometer range set to: +-2G
Gyro range set to: 250 degrees/s
Accelerometer data rate set to: 104 Hz
Gyro data rate set to: 104 Hz
               Temperature 23.87 deg C
               Accel X: 0.57 Y: -0.38
                                                Z: 39.52 m/s^2
               Gyro X: 3.16
                               Y: -5.15
                                                Z: -27.93 degrees/s
               Temperature 23.07 deg C
               Accel X: 0.15
                               Y: -0.10
                                                Z: 9.89 m/s^2
               Gyro X: 1.23
                                Y: 0.11
                                                Z: -0.51 degrees/s
```

Give the sensor a wiggle or a spin and watch how the measurements change!

## Example Code

```
// Basic demo for accelerometer & gyro readings from Adafruit
// LSM6DSOX sensor

#include <Adafruit_LSM6DSOX.h>

// For SPI mode, we need a CS pin
#define LSM_CS 10
// For software-SPI mode we need SCK/MOSI/MISO pins
#define LSM_SCK 13
```

```
#define LSM MISO 12
#define LSM MOSI 11
Adafruit LSM6DS0X sox;
void setup(void) {
 Serial.begin(115200);
 while (!Serial)
    delay(10); // will pause Zero, Leonardo, etc until serial console opens
 Serial.println("Adafruit LSM6DSOX test!");
 if (!sox.begin I2C()) {
   // if (!sox.begin SPI(LSM CS)) {
    // if (!sox.begin_SPI(LSM_CS, LSM_SCK, LSM_MISO, LSM_MOSI)) {
    // Serial.println("Failed to find LSM6DSOX chip");
   while (1) {
      delay(10);
    }
  }
 Serial.println("LSM6DS0X Found!");
  // sox.setAccelRange(LSM6DS_ACCEL_RANGE_2_G);
 Serial.print("Accelerometer range set to: ");
 switch (sox.getAccelRange()) {
  case LSM6DS ACCEL RANGE 2 G:
    Serial.println("+-2G");
    break;
  case LSM6DS ACCEL RANGE 4 G:
   Serial.println("+-4G");
  case LSM6DS ACCEL RANGE 8 G:
    Serial.println("+-8G");
    break;
  case LSM6DS ACCEL RANGE 16 G:
   Serial.println("+-16G");
    break;
 }
  // sox.setGyroRange(LSM6DS GYRO RANGE 250 DPS );
 Serial.print("Gyro range set to: ");
 switch (sox.getGyroRange()) {
  case LSM6DS GYRO RANGE 125 DPS:
    Serial.println("125 degrees/s");
   break:
  case LSM6DS GYRO RANGE 250 DPS:
    Serial.println("250 degrees/s");
    break;
  case LSM6DS GYRO RANGE 500 DPS:
    Serial.println("500 degrees/s");
    break:
  case LSM6DS GYRO RANGE 1000 DPS:
    Serial.println("1000 degrees/s");
  case LSM6DS GYRO RANGE 2000 DPS:
   Serial.println("2000 degrees/s");
  case ISM330DHCT GYRO RANGE 4000 DPS:
    break; // unsupported range for the DSOX
```

// sox.setAccelDataRate(LSM6DS RATE 12 5 HZ); Serial.print("Accelerometer data rate set to: "); switch (sox.getAccelDataRate()) { case LSM6DS RATE SHUTDOWN: Serial.println("0 Hz"); break; case LSM6DS\_RATE\_12\_5\_HZ: Serial.println("12.5 Hz"); break: case LSM6DS RATE 26 HZ: Serial.println("26 Hz"); break; case LSM6DS RATE 52 HZ: Serial.println("52 Hz"); break: case LSM6DS RATE 104 HZ: Serial.println("104 Hz"); break: case LSM6DS RATE 208 HZ: Serial.println("208 Hz"); break; case LSM6DS\_RATE\_416\_HZ: Serial.println("416 Hz"); case LSM6DS RATE 833 HZ: Serial.println("833 Hz"); break; case LSM6DS RATE 1 66K HZ: Serial.println("1.66 KHz"); case LSM6DS\_RATE\_3\_33K\_HZ: Serial.println("3.33 KHz"); case LSM6DS RATE 6 66K HZ: Serial.println("6.66 KHz"); break; } // sox.setGyroDataRate(LSM6DS RATE 12 5 HZ); Serial.print("Gyro data rate set to: "); switch (sox.getGyroDataRate()) { case LSM6DS RATE SHUTDOWN: Serial.println("0 Hz"); break: case LSM6DS RATE 12 5 HZ: Serial.println("12.5 Hz"); break; case LSM6DS\_RATE\_26\_HZ: Serial.println("26 Hz"); break: case LSM6DS\_RATE\_52\_HZ: Serial.println("52 Hz"); break; case LSM6DS RATE 104 HZ: Serial.println("104 Hz"); break: case LSM6DS RATE 208 HZ: Serial.println("208 Hz");

```
break;
  case LSM6DS RATE 416 HZ:
    Serial.println("416 Hz");
    break:
  case LSM6DS RATE 833 HZ:
    Serial.println("833 Hz");
  case LSM6DS_RATE_1_66K_HZ:
    Serial.println("1.66 KHz");
  case LSM6DS RATE 3 33K HZ:
    Serial.println("3.33 KHz");
  case LSM6DS RATE 6 66K HZ:
    Serial.println("6.66 KHz");
    break;
 }
}
void loop() {
 // /* Get a new normalized sensor event */
 sensors_event_t accel;
 sensors event t gyro;
 sensors event t temp;
 sox.getEvent(&accel, &gyro, &temp);
 Serial.print("\t\tTemperature ");
 Serial.print(temp.temperature);
 Serial.println(" deg C");
  /* Display the results (acceleration is measured in m/s^2) */
 Serial.print("\t\tAccel X: ");
  Serial.print(accel.acceleration.x);
  Serial.print(" \tY: ");
 Serial.print(accel.acceleration.y);
 Serial.print(" \tZ: ");
 Serial.print(accel.acceleration.z);
 Serial.println(" m/s^2 ");
  /* Display the results (rotation is measured in rad/s) */
 Serial.print("\t\tGyro X: ");
 Serial.print(gyro.gyro.x);
 Serial.print(" \tY: ");
 Serial.print(gyro.gyro.y);
 Serial.print(" \tZ: ");
  Serial.print(gyro.gyro.z);
 Serial.println(" radians/s ");
 Serial.println();
 delay(100);
 // // serial plotter friendly format
 // Serial.print(temp.temperature);
 // Serial.print(",");
 // Serial.print(accel.acceleration.x);
  // Serial.print(","); Serial.print(accel.acceleration.y);
  // Serial.print(","); Serial.print(accel.acceleration.z);
```

```
// Serial.print(",");

// Serial.print(gyro.gyro.x);

// Serial.print(","); Serial.print(gyro.gyro.y);

// Serial.print(","); Serial.print(gyro.gyro.z);

// Serial.println();

// delayMicroseconds(10000);
}
```

Arduino Docs (https://adafru.it/IAQ)

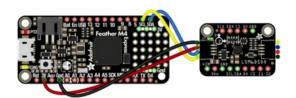

# Python & CircuitPython

It's easy to use the LSM6DSOX or ISM330DHCX sensors with Python and CircuitPython, and the Adafruit CircuitPython LSM6DS (https://adafru.it/lec) module. This module allows you to easily write Python code that reads measurements from the accelerometer and gyro, and will work with either sensor.

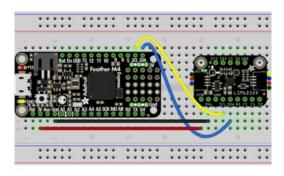

You can use this sensor with any CircuitPython microcontroller board or with a computer that has GPIO and Python thanks to Adafruit\_Blinka, our CircuitPython-for-Python compatibility library (https://adafru.it/BSN).

## CircuitPython Microcontroller Wiring

First wire up a LSM6DSOX or ISM330DHCX to your board for an I2C connection, exactly as shown below. Here's an example of wiring a Feather M4 to the sensor with I2C:

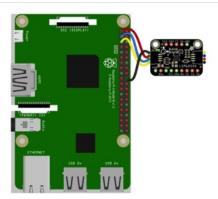

- Board 3V to sensor VIN (red wire)
- Board GND to sensor GND (black wire)
- Board SCL to sensor SCL (yellow wire)
- Board SDA to sensor SDA (blue wire)

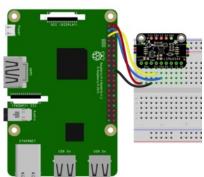

## Python Computer Wiring

Since there's *dozens* of Linux computers/boards you can use we will show wiring for Raspberry Pi. For other platforms, please visit the guide for CircuitPython on Linux to see whether your platform is supported (https://adafru.it/BSN).

Here's the Raspberry Pi wired with I2C:

- Pi 3V to sensor VCC (red wire)
- Pi GND to sensor GND (black wire)
- Pi SCL to sensor SCL (yellow wire)
- Pi SDA to sensor SDA (blue wire)

#### CircuitPython Installation of LSM6DS Library

You'll need to install the Adafruit CircuitPython LSM6DS (https://adafru.it/lec) library on your CircuitPython board. This library works with the LSM6DSOX, LSM6DS33, or ISM330DHCX

First make sure you are running the latest version of Adafruit CircuitPython (https://adafru.it/Amd) for your board.

Next you'll need to install the necessary libraries to use the hardware--carefully follow the steps to find and install these libraries from Adafruit's CircuitPython library bundle (https://adafru.it/ENC). Our CircuitPython starter guide has a great page on how to install the library bundle (https://adafru.it/ABU).

For non-express boards like the Trinket M0 or Gemma M0, you'll need to manually install the necessary libraries from the bundle:

- adafruit\_lsm6ds.mpy
- adafruit\_bus\_device
- adafruit\_register

Before continuing make sure your board's lib folder or root filesystem has the adafruit\_lsm6ds.mpy, adafruit\_bus\_device, and adafruit\_register files and folders copied over.

Next connect to the board's serial REPL (https://adafru.it/Awz)so you are at the CircuitPython >>> prompt.

Python Installation of LSM6DS Library

You'll need to install the Adafruit\_Blinka library that provides the CircuitPython support in Python. This may also require enabling I2C on your platform and verifying you are running Python 3. Since each platform is a little different, and Linux changes often, please visit the CircuitPython on Linux guide to get your computer ready (https://adafru.it/BSN)!

Once that's done, from your command line run the following command:

• sudo pip3 install adafruit-circuitpython-lsm6ds

If your default Python is version 3 you may need to run 'pip' instead. Just make sure you aren't trying to use CircuitPython on Python 2.x, it isn't supported!

#### CircuitPython & Python Usage

To demonstrate the usage of the sensor we'll initialize it and read the acceleration and rotation measurements from the board's Python REPL.

Run the following code to import the necessary modules and initialize the I2C connection with the sensor:

```
import time
import board
import busio
import adafruit_lsm6ds

i2c = busio.I2C(board.SCL, board.SDA)
sox = adafruit_lsm6ds.LSM6DSOX(i2c)
```

Now you're ready to read values from the sensor using these properties:

- acceleration The acceleration forces in the X, Y, and Z axes in m/s<sup>2</sup>
- gyro The rotation measurement on the X, Y, and Z axes in degrees/sec

For example, to print out the acceleration and gyro measurements use this code:

```
print("Acceleration: X:%.2f, Y: %.2f, Z: %.2f m/s^2" % (sensor.acceleration))
print("Gyro X:%.2f, Y: %.2f, Z: %.2f degrees/s" % (sensor.gyro))
```

```
Acceleration: X:-0.12, Y: -0.04, Z: 9.85 m/s^2
>>> print("Gyro X:%.2f, Y: %.2f, Z: %.2f degrees/s"%(sox.gyro))
Gyro X:1.08, Y: 0.08, Z: -1.58 degrees/s
>>> |
```

That's all there is to it! Go forth and imbue your robot friends with the gift of being able to maybe not fall down all the time. Maybe.

#### Example Code

```
import time
import board
import busio
from adafruit_lsm6ds import LSM6DSOX

i2c = busio.I2C(board.SCL, board.SDA)

sensor = LSM6DSOX(i2c)

while True:
    print("Acceleration: X:%.2f, Y: %.2f, Z: %.2f m/s^2" % (sensor.acceleration))
    print("Gyro X:%.2f, Y: %.2f, Z: %.2f degrees/s" % (sensor.gyro))
    print("")
    time.sleep(0.5)
```
