## **CIRCUIT FUNCTION AND BENEFITS**

The circuit shown i[n Figure 1](#page-0-0) is a complete adjustment-free linear variable differential transformer (LVDT) signal conditioning circuit. This circuit can accurately measure linear displacement (position).

The LVDT is a highly reliable sensor because the magnetic core can move without friction and does not touch the inside of the tube. Therefore, LVDTs are suitable for flight control feedback systems, position feedback in servomechanisms, automated measurement in machine tools, and many other industrial and scientific electromechanical applications where long term reliability is important.

This circuit uses th[e AD598](http://www.analog.com/AD598?doc=cn0288.pdf) LVDT signal conditioner that contains a sine wave oscillator and a power amplifier to generate the excitation signals that drive the primary side of the LVDT. The [AD598](http://www.analog.com/AD598?doc=cn0288.pdf) also converts the secondary output into a dc voltage. The [AD8615](http://www.analog.com/AD8615?doc=cn0288.pdf) rail-to-rail amplifier buffers the output of th[e AD598](http://www.analog.com/AD598?doc=cn0288.pdf) and drives a low power 12-bit successive approximation analog-todigital converter (ADC). The system has a dynamic range of 82 dB and a system bandwidth of 250 Hz, making it ideal for precision industrial position and gauging applications.

The signal conditioning circuitry of the system consumes only 15 mA of current from the ±15 V supply and 3 mA from the +5 V supply, making this ideal for remote applications. The circuit can operate a remote LVDT from up to 300 feet away, and the output can drive up to 1000 feet.

This circuit note discusses basic LVDT theory of operation and the design steps used to optimize the circuit shown in [Figure 1](#page-0-0) for a chosen bandwidth, including noise analysis and component selection considerations.

*Figure 1. LVDT Signal Conditioning Circuit (Simplified Schematic: All Connections and Decoupling Not Shown)*

<span id="page-0-0"></span>**Rev. 0 Circuits from the Lab™ circuits from Analog Devices have been designed and built by Analog Devices engineers. Standard engineering practices have been employed in the design and construction of each circuit, and their function and performance have been tested and verified in a lab environment at room temperature. However, you are solely responsible for testing the circuit and determining its suitability and applicability for your use and application. Accordingly, in no event shall Analog Devices be liable for direct, indirect, special, incidental, consequential or punitive damages due to any cause whatsoever connected to the use of any Circuits from the Lab circuits. # **CIRCUIT DESCRIPTION**

# *Theory of Operation*

An LVDT is an absolute displacement transducer that converts a linear displacement or position from a mechanical reference (or zero) into a proportional electrical signal containing phase (for direction) and amplitude information (for distance). The LVDT operation does not require electrical contact between the moving part (probe or core rod assembly) and the transformer. Instead, it relies on electromagnetic coupling. For this reason, and because they operate without any built-in electronic circuitry, LVDTs are widely used in applications where long life and high reliability under severe environments are a required, such military and aerospace applications.

For this circuit, the E-100 Economy Series LVDT sensor from Measurement Specialties™, Inc. was used with th[e AD598.](http://www.analog.com/AD598?doc=cn0288.pdf) With a linearity of ±0.5% of full range, the E Series is suitable for most applications with moderate operation temperature environments.

The [AD598](http://www.analog.com/AD598?doc=cn0288.pdf) is a complete, LVDT signal conditioning subsystem. It converts the transducer mechanical position of LVDTs to a unipolar dc voltage with a high degree of accuracy and repeatability. All circuit functions are included on the chip. With the addition of a few external passives components to set frequency and gain, the [AD598](http://www.analog.com/AD598?doc=cn0288.pdf) converts the raw LVDT secondary output to a scaled dc signal.

The [AD598](http://www.analog.com/AD598?doc=cn0288.pdf) contains a low distortion sine wave oscillator to drive the LVDT primary. The frequency of the sine wave is determined by a single capacitor and can range from 20 Hz to 20 kHz with amplitudes from 2 V rms to 20 V rms.

The LVDT secondary output consists of two sine waves that drive th[e AD598](http://www.analog.com/AD598?doc=cn0288.pdf) directly. The [AD598](http://www.analog.com/AD598?doc=cn0288.pdf) operates upon the two signals, dividing their difference by their sum and producing a scaled unipolar dc output. Previous LVDT conditioners synchronously detect this amplitude difference and convert its absolute value to a voltage proportional to position. This technique uses the primary excitation voltage as a phase reference to determine the polarity of the output voltage. There are a number of problems associated with this technique. They include:

- Producing a constant amplitude, constant frequency excitation signal
- Compensating for LVDT primary to secondary phase shifts
- Compensating for these shifts as a function of temperature and frequency

Th[e AD598](http://www.analog.com/AD598?doc=cn0288.pdf) eliminates all of these problems. The [AD598](http://www.analog.com/AD598?doc=cn0288.pdf) does not require a constant amplitude because it works on the ratio of the difference and sum of the LVDT output signals. A constant frequency signal is not necessary because the inputs are rectified and only the sine wave carrier magnitude is processed. There is no sensitivity to phase shift between the primary and the LVDT outputs because synchronous detection is not employed.

The ratiometric principle upon which th[e AD598](http://www.analog.com/AD598?doc=cn0288.pdf) operates requires that the sum of the LVDT secondary voltages remains constant with LVDT stroke length. Although LVDT manufacturers generally do not specify the relationship between  $V_A + V_B$  and stroke length, it is recognized that some LVDTs do not meet this requirement. In these cases, a nonlinearity results. However, the majority of available LVDTs do in fact meet these requirements.

## *Component Selection*

The design procedure for the dual supply operation  $(\pm 15 \text{ V})$ found in th[e AD598](http://www.analog.com/AD598?doc=cn0288.pdf) data sheet was followed to set the excitation frequency to 2.5 kHz, system bandwidth to 250 Hz, and an output voltage from 0 V to 5 V.

It is normal for th[e AD598](http://www.analog.com/AD598?doc=cn0288.pdf) internal oscillator to produce a small amount of ripple that feeds through to the output. A passive low-pass filter is used to reduce this ripple to the required level.

When selecting capacitor values to set the bandwidth of the system, a trade-off is involved. Choosing smaller capacitors give higher system bandwidth but increase the amount of output voltage ripple. The ripple can be reduced by increasing the shunt capacitance across the feedback resistor used to set the output voltage level; however, this also increases phase lag.

The [AD8615](http://www.analog.com/AD8615?doc=cn0288.pdf) operational amplifier buffers the output of the [AD598,](http://www.analog.com/AD598?doc=cn0288.pdf) which ensures that the [AD7992](http://www.analog.com/AD7992?doc=cn0288.pdf) ADC is driven by a low impedance source (high source impedances significantly affect the ac performance of the ADC).

The low-pass filter between the output of the [AD598](http://www.analog.com/AD598?doc=cn0288.pdf) and the input of the [AD8615](http://www.analog.com/AD8615?doc=cn0288.pdf) serves two purposes:

- It limits the input current to th[e AD8615](http://www.analog.com/AD8615?doc=cn0288.pdf)
- It filters the output voltage ripple.

The [AD8615](http://www.analog.com/AD8615?doc=cn0288.pdf) has internal protective circuitry that allows voltages exceeding the supply to be applied at the input. This is important because the output voltage of th[e AD598](http://www.analog.com/AD598?doc=cn0288.pdf) can swing ±11 V with ±15 V supplies. As long as the input current is limited to less than 5 mA, higher voltages can be applied to the input. This is primarily due to the extremely low input bias current of the [AD8615](http://www.analog.com/AD8615?doc=cn0288.pdf) (1 pA) which allows the use of larger resistors. The use of these resistors adds thermal noise, which contributes to the overall output voltage noise of the amplifier.

The [AD8615](http://www.analog.com/AD8615?doc=cn0288.pdf) is an ideal amplifier to buffer and drive the input of the [AD7992](http://www.analog.com/AD7992?doc=cn0288.pdf) 12-bit SAR ADC because of its input overvoltage protection, and its ability to swing rail-to-rail at both the input and output.

# Circuit Note CN-0288

# *Noise Analysis*

With all signal condition components selected, the amount of resolution needed to convert the signal must be determined. As in most noise analyses, only the key contributors need to be identified. Noise sources combine in an rss manner; therefore, any single noise source that is at least three-to-four times larger than any of the others dominates.

In the case of the LVDT signal conditioning circuit, the dominant source of the output noise is the output ripple of the [AD598.](http://www.analog.com/AD598?doc=cn0288.pdf)  The other sources of noise (resistor noise, input voltage noise, and output voltage noise of the [AD8615\)](http://www.analog.com/AD8615?doc=cn0288.pdf) are significantly smaller in comparison.

The output voltage ripple of th[e AD598](http://www.analog.com/AD598?doc=cn0288.pdf) is 0.4 mV rms with a 0.39 µF capacitor value and with a 10 nF shunt capacitor across the feedback resistor shown in [Figure 2.](#page-2-0) Note that these components and related pin connections are not shown in the simplified schematic in [Figure 1;](#page-0-0) however, details can be found in the [AD598](http://www.analog.com/AD598?doc=cn0288.pdf) data sheet.

<span id="page-2-0"></span>The maximum number of rms counts that can be resolved can now be calculated by dividing the full-scale output by the total system rms noise.

*Total RMS Counts* = 5 V/0.4 mV = 12, 500

The effective resolution is found by taking the base 2 logarithm of the total rms counts.

*Effective Resolution* =  $log_2(12,500)$  = 13.6 Bits

Noise-free code resolution can be obtained by subtracting 2.7 bits from the effective resolution.

*Noise-Free Code Resolution* = *Effective Resolution* − 2.7 Bits = 13.6 Bits − 2.7 Bits

$$
= 10.9 \text{ bits}
$$

The total output dynamic range of the system can be calculated by dividing the full-scale output signal (5 V) by the total output rms noise (0.4 mV rms) and converting it to decibels, yielding approximately 82 dB.

*Dynamic Range* = 20 log(5 V/0.4 mV) = 82 dB

The [AD7992](http://www.analog.com/AD7992?doc=cn0288.pdf) is a good candidate for this application because it has 12-bit resolution and a sampling rate of 188 kSPS per channel when used with a 3.4 MHz serial clock.

# *Test Results*

Using a Measurement Specialties, Inc. E-100 Economy Series LVDT connected to J3 and using a digital oscilloscope to monitor the output of th[e AD598](http://www.analog.com/AD598?doc=cn0288.pdf) found on J6 on the [EVAL-](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf)[CN0288-SDPZ](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf) evaluation board, the actual output ripple found was 6.6 mV p-p, as is shown i[n Figure 3.](#page-2-1)

<span id="page-2-1"></span>The low-pass filter (3 k $\Omega$ , 0.01 µF) between the [AD598](http://www.analog.com/AD598?doc=cn0288.pdf) output and th[e AD8615](http://www.analog.com/AD8615?doc=cn0288.pdf) input has a −3 dB bandwidth of 5.3 kHz and reduces the ripple to 2 mV p-p.

With the low-pass filter installed between the output stage of the [AD598](http://www.analog.com/AD598?doc=cn0288.pdf) and the input stage of the [AD8615,](http://www.analog.com/AD8615?doc=cn0288.pdf) data was collected from the [EVAL-CN0288-SDPZ](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf) evaluation board, as shown i[n Figure 4.](#page-2-2)

*Figure 4. Screenshot of th[e CN-0288 Evaluation Software](ftp://ftp.analog.com/pub/cftl/CN0288/)*

11426-004

<span id="page-2-2"></span>The ripple from th[e AD598](http://www.analog.com/AD598?doc=AD598.pdf) was attenuated to 2 mV p-p, and the system was able to achieve 11 bits of noise-free code resolution.

A complete design support package for this circuit note can be found at [http://www.analog.com/CN0288-DesignSupport.](http://www.analog.com/CN0288-DesignSupport?doc=cn0288.pdf) 

# *Applications in Flight Control Surface Position Feedback*

Unmanned autonomous vehicles (UAVs), or drones, are playing an ever-increasing part in the national security of the United States. These high technology, complex aerial platforms are controlled by a crew miles away and are multimission capable. They include roles such as aerial reconnaissance, combat weapons platforms, battlefield theater command and control oversight, or unmanned in-flight refueling station.

The complex systems employed on UAVs use a myriad of electronic sensors for precise control and feedback. To control the altitude (pitch, roll, and yaw) of the UAV, actuators are used to exert forces on the flight control surfaces. The precise measurement of the position of these actuators is crucial in maintaining the proper flight of path.

The sensors used to measure actuator position need to meet three essential criteria: high accuracy, high reliability, and light weight. All three of these attributes are found in the LVDTs designed by Measurement Specialties, Inc.

#### *Synchronous Operation of Multiple LVDTs*

In many applications, such as multiple gaging measurement, a large number of LVDTs are used in close proximity. If these LVDTs operate at similar carrier frequencies, stray magnetic coupling can cause beat notes to be generated. The resulting beat notes may interfere with the accuracy of measurements made under these conditions. To avoid this situation, all LVDTs operate synchronously.

The [EVAL-CN0288-SDPZ](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf) evaluation board can be configured to have one master oscillator between two LVDTs by populating Jumper JP1 to Jumper JP3 with a shorting jumper and leaving JP4 unpopulated. Each LVDT primary is driven from its own power amplifier, and, thus, the thermal load is shared between the [AD598s](http://www.analog.com/AD598?doc=cn0288.pdf).

# **COMMON VARIATIONS**

The components selected were optimized for a maximum 5 V unipolar output from the [AD598;](http://www.analog.com/AD598?doc=cn0288.pdf) however, other combinations can be substituted.

Other suitable single-supply amplifiers are th[e AD8565](http://www.analog.com/AD8565?doc=cn0288.pdf) and [AD8601.](http://www.analog.com/AD8601?doc=cn0288.pdf) These amplifiers are suitable replacements for the [AD8615](http://www.analog.com/AD8615?doc=cn0288.pdf) because they have input overvoltage protection and the ability to swing rail-to-rail at both the input and output. If dualsupply operation is required, th[e ADA4638-1](http://www.analog.com/ADA4638-1?doc=cn0288.pdf) o[r ADA4627-1](http://www.analog.com/ADA4627-1?doc=cn0288.pdf) is suggested.

If th[e AD598](http://www.analog.com/AD598?doc=cn0288.pdf) outputs ±10 V bipolar signals, th[e AD7321](http://www.analog.com/AD7321?doc=cn0288.pdf) is suggested. Th[e AD7321](http://www.analog.com/AD7321?doc=cn0288.pdf) is a 2-channel, bipolar input, 12-bit ADC that can accept true bipolar analog input signals as large as  $\pm 10$  V.

# **CIRCUIT EVALUATION AND TEST**

This circuit uses the [EVAL-CN0288-SDPZ](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf) circuit board and the [EVAL-SDP-CB1Z](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf) SDP-B system demonstration platform controller board. The two boards have 120-pin mating connectors, allowing for the quick setup and evaluation of the performance of the circuit. Th[e EVAL-CN0288-SDPZ](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf) contains the circuit to be evaluated, and th[e EVAL-SDP-CB1Z](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf) (SDP-B) is used with the [CN-0288 evaluation software](ftp://ftp.analog.com/pub/cftl/CN0288) to capture the data from the [EVAL-CN0288-SDPZ.](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf)

#### *Equipment Needed*

The following equipment is needed:

- A PC with a USB port and Windows® XP (32 bit), Windows Vista®, or Windows 7
- The [EVAL-CN0288-SDPZ](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf) circuit board
- The [EVAL-SDP-CB1Z](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf) SDP-B controller board
- The [CN-0288 evaluation software](ftp://ftp.analog.com/pub/cftl/CN0288)
- The [EVAL-CFTL-6V-PWRZ](http://www.analog.com/EVAL-CFTL-6V-PWRZ?doc=cn0288.pdf) dc power supply or equivalent 6 V/1 A bench supply
- Measurement Specialties, Inc., E-100 Economy Series LVDT [\(EVAL-CFTL-LVDT\)](http://www.analog.com/EVAL-CFTL-LVDT?doc=cn0288.pdf)

#### *Getting Started*

Load the evaluation software by placing th[e CN-0288 evaluation](ftp://ftp.analog.com/pub/cftl/CN0288/)  [software](ftp://ftp.analog.com/pub/cftl/CN0288/) into the CD drive of the PC. Using **My Computer**, locate the drive that contains the evaluation software.

#### *Functional Block Diagram*

Se[e Figure 1](#page-0-0) for the circuit block diagram and the **EVAL-CN0288- SDPZ-PADSSchematic.pdf** file for the complete circuit schematic. The PDF file can be found in the [CN-0288 Design Support](http://www.analog.com/CN0288-DesignSupport?doc=cn0288.pdf)  [Package.](http://www.analog.com/CN0288-DesignSupport?doc=cn0288.pdf) 

*Figure 5. Test Setup Block Diagram*

# Circuit Note CN-0288

#### *Setup*

Connect the 120-pin connector on th[e EVAL-CN0288-SDPZ](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf) to the **CON A** connector on th[e EVAL-SDP-CB1Z](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf) (SDP-B). Use nylon hardware to firmly secure the two boards, using the holes provided at the ends of the 120-pin connectors. With power to the supply off, connect a 6 V power supply to the +6 V and GND pins on the board. If available, a 6 V wall wart can be connected to the barrel connector on the board and used in place of the 6 V power supply. Connect the USB cable supplied with th[e EVAL-](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf)[SDP-CB1Z](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf) to the USB port on the PC. Do not connect the USB cable to the Mini-USB connector on th[e EVAL-SDP-CB1Z](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf) at this time.

#### *Test*

Apply power to the 6 V supply (or wall wart) connected to the [EVAL-CN0288-SDPZ.](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf) Launch the evaluation software and connect the USB cable from the PC to the Mini-USB connector on the [EVAL-SDP-CB1Z.](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf) 

When USB communications are established, th[e EVAL-SDP-](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf)[CB1Z](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf) can send, receive, and capture parallel data from the [EVAL-CN0288-SDPZ.](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf)

[Figure 6](#page-4-0) shows a photo of the [EVAL-CN0288-SDPZ](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf) connected to the [EVAL-SDP-CB1Z.](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf) Information regarding [the EVAL-SDP-](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf)[CB1Z](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf) can be found in th[e UG-277 User Guide.](http://www.analog.com/UG-277?doc=cn0288.pdf) 

Information and details regarding test setup and calibration, and how to use the evaluation software for data capture can be found in the [CN-0288 Software User Guide](http://www.analog.com/CN0288-UserGuide?doc=cn0288.pdf).

#### *Connectivity for Prototype Development*

The [EVAL-CN0288-SDPZ](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf) is designed to use the [EVAL-SDP-](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf)[CB1Z;](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf) however, any microprocessor can be used to interface to the I<sup>2</sup>C 2-wire serial interface of the [AD7992. I](http://www.analog.com/AD7992?doc=cn0288.pdf)n order for another controller to be used with the [EVAL-CN0288-SDPZ,](http://www.analog.com/eval-CN0288-sdpz?doc=cn0288.pdf)  software must be developed by a third party.

There are existing interposer boards that can be used to interface to the Altera and Xilinx field programmable gate arrays (FPGAs). The BeMicro SDK board from Altera can be used with the BeMicro SDK/SDP interposer using nios drivers. Any Xilinx evaluation board that features the FMC connector can be used with the FMC-SDP interposer board.

The [EVAL-CN0288-SDPZ](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf) is also compatible with the Digilent, Imod interface specification.

<span id="page-4-0"></span>A photo of the system is shown in [Figure 6.](#page-4-0) 

*Figure 6. [The EVAL-CN0288-SDPZ](http://www.analog.com/EVAL-CN0288-SDPZ?doc=cn0288.pdf) Board Connected t[o EVAL-SDP-CB1Z \(SDP-B\)](http://www.analog.com/EVAL-SDP-CB1Z?doc=cn0288.pdf) Board and Measurement Specialties, Inc., E-100 Economy Series LVDT*

#### **REVISION HISTORY**

**3/13—Revision 0: Initial Version**

**(Continued from first page) Circuits from the Lab circuits are intended only for use with Analog Devices products and are the intellectual property of Analog Devices or its licensors. While you may use the Circuits from the Lab circuits in the design of your product, no other license is granted by implication or otherwise under any patents or other intellectual property by application or use of the Circuits from the Lab circuits. Information furnished by Analog Devices is believed to be accurate and reliable. However, Circuits from the Lab circuits are supplied "as is" and without warranties of any kind, express, implied, or statutory including, but not limited to, any implied warranty of merchantability, noninfringement or fitness for a particular purpose and no responsibility is assumed by Analog Devices for their use, nor for any infringements of patents or other rights of third parties that may result from their use. Analog Devices reserves the right to change any Circuits from the Lab circuits at any time without notice but is under no obligation to do so.**
