

**3-PHASE AC Motor Controller IC**

**Features**

- Floating channel up to +1200V
- “soft” over-current shutdown turns off output
- Integrated desaturation circuit
- Two stage turn on output for di/dt control
- Integrated brake IGBT driver with protection
- Voltage feedback sensing function
- Separate pull-up/pull-down output drive pins
- Matched delay outputs
- Under voltage lockout with hysteresis band
- Programmable deadtime
- Hard shutdown function

**Description**

The IR2238Q is a high voltage, 3-phase IGBT driver best suited for AC motor drive applications. Integrated desaturation logic provides all mode of overcurrent protection, including ground fault protection. Soft shutdown is predominantly initiated in the event of overcurrent followed by turn-off of all six outputs. A shutdown input is provided for a customized shutdown function. The DT pin allows external resistor to program the deadtime. Output drivers have separate turn on/off pins with two stage turn-on output to achieve the desired di/dt switching level of IGBT. Voltage feedback provides accurate volts \*seconds measurement.

**Product Summary**

$V_{OFFSET}$	1200V max.
$I_{O+/-}$ (min.)	220mA/460mA
$V_{OUT}$	12.5V - 20V
Brake ( $I_{O+/-}$ min)	40mA/80mA
Deadtime Asymmetry Skew (max.)	145nsec
Deadtime (typ. with $R_{DT}=39k\Omega$ )	1 $\mu$ sec
DESAT Blanking time (typ.)	3.0 $\mu$ sec
DSH, DSL input voltage threshold (typ.)	8.0V
Soft shutdown duration time (typ.)	6.0 $\mu$ sec
Voltage feedback matching delay time (max.)	125nsec

**Package**

## Absolute Maximum Ratings (tentative)

Absolute maximum ratings indicate sustained limits beyond which damage to the device may occur. All voltage parameters are absolute voltages referenced to COM, all currents are defined positive into any lead. The thermal resistance and power dissipation ratings are measured under board mounted and still air conditions.

Symbol	Definition	Min.	Max.	Units	
V <sub>S</sub>	High side offset voltage	V <sub>B1,2,3</sub> -25	V <sub>B1,2,3</sub> +0.3	V	
V <sub>B</sub>	High side floating supply voltage	-0.3	1225		
V <sub>HO</sub>	High side floating output voltage (HOP, HON, HOQ)	V <sub>S1,2,3</sub> - 0.3	V <sub>B1,2,3</sub> + 0.3		
V <sub>CC</sub>	Low side and logic fixed supply voltage	-0.3	25		
V <sub>SS</sub>	Logic ground	V <sub>CC</sub> - 25	V <sub>CC</sub> + 0.3		
V <sub>LO</sub>	Low side output voltage (LOP, LON, LOQ)	-0.3	V <sub>CC</sub> + 0.3		
V <sub>IN</sub>	Logic input voltage (HIN/N,LIN, BRIN/N, SD)	V <sub>SS</sub> - 0.3	V <sub>CC</sub> + 0.3 or V <sub>SS</sub> + 15 which ever is lower		
V <sub>FLT</sub>	FAULT output voltage	V <sub>SS</sub> - 0.3	V <sub>CC</sub> + 0.3		
V <sub>F</sub>	Feedback output voltage	V <sub>SS</sub> - 0.3	V <sub>CC</sub> + 0.3		
V <sub>DSH</sub>	High side desat/feedback input voltage	V <sub>S1,2,3</sub> - 0.3	V <sub>B1,2,3</sub> + 0.3		
V <sub>DSL</sub>	Low side desat/feedback input voltage	- 0.3	V <sub>CC</sub> + 0.3		
V <sub>BR</sub>	Brake output voltage	-0.3	V <sub>CC</sub> + 0.3		
dV <sub>S</sub> /dt	Allowable offset voltage slew rate	—	50		V/ns
P <sub>D</sub>	Package power dissipation @ T <sub>A</sub> ≤ +25°C	—	2.0		W
R <sub>thJA</sub>	Thermal resistance, junction to ambient	—	60	°C/W	
T <sub>J</sub>	Junction temperature	—	125	°C	
T <sub>S</sub>	Storage temperature	-55	150		
T <sub>L</sub>	Lead temperature (soldering, 10 seconds)	—	300		

## Recommended Operating Conditions

For proper operation the device should be used within the recommended conditions. All voltage parameters are absolute voltages referenced to COM. The V<sub>S</sub> offset rating is tested with all supplies biased at 15V differential.

Symbol	Definition	Min.	Max.	Units
V <sub>B1,2,3</sub>	High side floating supply voltage	V <sub>S1,2,3</sub> + 13	V <sub>S1,2,3</sub> + 20	V
V <sub>S1,2,3</sub>	High side floating supply offset voltage	Note 1	1200	
V <sub>HO1,2,3</sub>	High side (HOP/HOQ/HON) output voltage	V <sub>S1,2,3</sub>	V <sub>B1,2,3</sub>	
V <sub>LO1,2,3</sub>	Low side (LOP/LOQ/LON) output voltage	V <sub>COM</sub>	V <sub>CC</sub>	
V <sub>IN</sub>	Logic input voltage (HIN/N,LIN, BRIN/N SD)	V <sub>SS</sub>	V <sub>SS</sub> + 5	
V <sub>CC</sub>	Low side supply voltage	12.5	20	
V <sub>SS</sub>	Logic ground	-5	+5	
V <sub>FLT</sub>	FAULT output voltage	V <sub>SS</sub>	V <sub>CC</sub>	
V <sub>F</sub>	Feedback output voltage	V <sub>SS</sub>	V <sub>CC</sub>	
V <sub>DSH</sub>	High side desat/feedback input voltage	V <sub>S1,2,3</sub> - 0.3	V <sub>B1,2,3</sub>	
V <sub>DSL</sub>	Low side desat/feedback input voltage	- 0.3	V <sub>CC</sub>	
V <sub>BR</sub>	BRAKE output voltage	V <sub>COM</sub>	V <sub>CC</sub>	
T <sub>A</sub>	Ambient temperature	-20	115	°C

Note 1: Logic operational for V<sub>S</sub> of COM-5V to COM+1200V. Logic state held for V<sub>S</sub> of COM-5V to COM-V<sub>BS</sub>.

## Static Electrical Characteristics

$V_{BIAS}$  ( $V_{CC}$ ,  $V_{BS1,2,3}$ ) = 15V and  $T_A$  = 25°C unless otherwise specified. The  $V_{IN}$ ,  $V_{TH}$  and  $I_{IN}$  parameters are referenced to  $V_{SS}$  and are applicable to all six channels (HOP/HOQ/HON1,2,3 and LOP/LOQ/LON1,2,3). The  $V_O$  and  $I_O$  parameters are referenced to COM and  $V_{S1,2,3}$  and are applicable to the respective output leads: HO1,2,3 and LO1,2,3.  $V_{DESAT}$  and  $I_{DESAT}$  parameters are referenced to COM and  $V_{S1,2,3}$

Symbol	Definition	Min.	Typ.	Max.	Units	Test Conditions
$V_{CCUV+}$	$V_{CC1}$ supply undervoltage positive going threshold	10.3	11.2	12.5	V

## Lead Definitions

Symbol	Description
V <sub>CC</sub>	Low side supply voltage
V <sub>SS</sub>	Logic Ground
HIN <sub>1,2,3</sub>	Logic inputs for high side gate driver outputs (HOP <sub>1,2,3</sub> /HON <sub>1,2,3</sub> , out of phase)
LIN <sub>1,2,3</sub>	Logic inputs for low side gate driver outputs (LOP <sub>1,2,3</sub> /LON <sub>1,2,3</sub> , out of phase)
FAULT	Fault output (latched and open drain)
SD	Shutdown input
DT	Deadtime programmable resistor pin
DSB	Brake IGBT desaturation protection input and voltage feedback input
BRIN	Logic input for brake driver
BR	Brake driver output
COM	Low side drivers return
V <sub>B</sub> <sub>1,2,3</sub>	High side gate drive floating supply
HOP <sub>1,2,3</sub>	High side driver sourcing output
HOQ <sub>1,2,3</sub>	High side driver boost sourcing output
HON <sub>1,2,3</sub>	High side driver sinking output
DSH <sub>1,2,3</sub>	IGBT desaturation protection input and high side voltage feedback input
V <sub>S</sub> <sub>1,2,3</sub>	High voltage floating supply return
LOP <sub>1,2,3</sub>	Low side driver sourcing output
LON <sub>1,2,3</sub>	Low side driver sinking output
DSL <sub>1,2,3</sub>	IGBT desaturation protection input and low side voltage feedback input
VFH <sub>1,2,3</sub>	High side voltage feedback logic output
VFL <sub>1,2,3</sub>	Low side voltage feedback logic output

### NOTE:

LD1- Low side soft shutdown is initiated locally in an event over current, which is sensed by the DSL pin. It is followed by the synchronized soft shutdown of the rest of the low side outputs; meanwhile it will hold all input information for a period of  $t_{ss}$  until the soft shutdown finishes. Then the hard shutdown will be initiated to complete the shut down cycle. (Figure 6.1)

High side soft shutdown is initiated locally in an event over current, which is sensed by the DSH pin. It is followed by the synchronized soft shutdown of all the low side outputs; meanwhile it will hold all input information for a period of  $t_{ss}$  until the soft shutdown finishes. Then the hard shutdown will be initiated to complete the shut down cycle. (Figure 6.2)

LD2- Soft shutdown is initiated in an event of overcurrent, which is followed by turn-off all six outputs. The fault condition will remain in a fixed period( $t_{fault}$ ) even though the faultclear condition is in effect (Fig11). In the case that faultclear is not in effect, fault duration =  $t_{fault} + t_{ftclr}$ .

Case outline
