2. C_{PD} is defined as the value of the internal equivalent capacitance which is derived from dynamic operating current consumption (I_{CCD}) at no output loading and operating at 50% duty cycle. C_{PD} is related to I_{CCD} dynamic operating current by the expression:
 $I_{CCD} = (C_{PD}) (V_{CC}) (f_{IN}) + (I_{CCstatic})$.

NOTE:
 3. C_L includes load and stray capacitance.
 4. Input PRR = 1.0 MHz; t_W = 500 ns

Figure 4. AC Test Circuit

Figure 5. AC Waveforms

NOTE:

- When operating the NC7SZU04's unbuffered output stage in its linear range, as in oscillator applications, care must be taken to observe maximum power rating for the device and package. The high drive nature of the design of the output stage results in substantial simultaneous conduction currents when the stage is in the linear region. See the I_{CCPEAK} specification in the [DC Electrical Characteristics](#) table.
- Input = AC Waveform; t_r = t_f = 1.8 ns; PRR = Variable; Duty Cycle = 50%.
