1. SCOPE

1.1 Scope. This drawing documents two product assurance class levels consisting of high reliability (device classes Q and M) and space application (device class V). A choice of case outlines and lead finishes are available and are reflected in the Part or Identifying Number (PIN). When available, a choice of Radiation Hardness Assurance (RHA) levels are reflected in the PIN.

1.2 PIN. The PIN is as shown in the following example:

For device classes M and Q:

For device class V:

1.2.1 RHA designator. Device classes Q and V RHA marked devices meet the MIL-PRF-38535 specified RHA levels and are marked with the appropriate RHA designator. Device class M RHA marked devices meet the MIL-PRF-38535, appendix A specified RHA levels and are marked with the appropriate RHA designator. A dash (-) indicates a non-RHA device.

1.2.2 Device type(s). The device type(s) identify the circuit function as follows:

<u>Device type</u>	<u>Generic number</u>	<u>Circuit function</u>
01	54AC138	1-of-8 decoder/demultiplexer

1.2.3 Device class designator. The device class designator is a single letter identifying the product assurance level as listed below. Since the device class designator has been added after the original issuance of this drawing, device classes M and Q designators will not be included in the PIN and will not be marked on the device.

<u>Device class</u>	<u>Device requirements documentation</u>
M	Vendor self-certification to the requirements for MIL-STD-883 compliant, non-JAN class level B microcircuits in accordance with MIL-PRF-38535, appendix A
Q or V	Certification and qualification to MIL-PRF-38535

1/ For tests not listed in the referenced MIL-STD-883, [e.g. V<sub>IH</sub>, V<sub>IL</sub>], utilize the general test procedure under the conditions listed herein.

2/ Each input/output, as applicable, shall be tested at the specified temperature, for the specified limits, to the tests in table IA herein. Output terminals not designated shall be high level logic, low level logic, or open, except as follows:

- a. V<sub>IC</sub> (pos) tests, the GND terminal can be open. T<sub>C</sub> = +25°C.
- b. V<sub>IC</sub> (neg) tests, the V<sub>CC</sub> terminal shall be open. T<sub>C</sub> = +25°C.
- c. All I<sub>CC</sub> tests, the output terminal shall be open. When performing these tests, the current meter shall be placed in the circuit such that all current flows through the meter.

3/ RHA parts for device type 01 supplied to this drawing have been characterized through all levels M, D, P, L, R, and F of irradiation. However, this device is only tested at the 'F' level. Pre and Post irradiation values are identical unless otherwise specified in Table IA. When performing post irradiation electrical measurements for any RHA level, T<sub>A</sub> = +25°C.

4/ For negative and positive voltage and current values, the sign designates the potential difference in reference to GND and the direction of current flow, respectively; and the absolute value of the magnitude, not the sign, is relative to the minimum and maximum limits, as applicable, listed herein. All devices shall meet or exceed the limits specified in table IA, as applicable, at 3.0 V ≤ V<sub>CC</sub> ≤ 3.6 V and 4.5 V ≤ V<sub>CC</sub> ≤ 5.5 V.

5/ The V<sub>OH</sub> and V<sub>OL</sub> tests shall be tested at V<sub>CC</sub> = 3.0 V and 4.5 V. The V<sub>OH</sub> and V<sub>OL</sub> tests are guaranteed, if not tested, for other values of V<sub>CC</sub>. Limits shown apply to operation at V<sub>CC</sub> = 3.3 V ± 0.3 V and V<sub>CC</sub> = 5.0 V ± 0.5 V. Tests with input current at +50 mA or -50 mA are performed on only one input at a time with duration not to exceed 10 ms. Transmission driving tests may be performed using V<sub>IN</sub> = V<sub>CC</sub> or GND. When V<sub>IN</sub> = V<sub>CC</sub> or GND is used, the test is guaranteed for V<sub>IN</sub> = V<sub>IH</sub> minimum and V<sub>IL</sub> maximum.

TABLE IA. Electrical performance characteristics - Continued.

- 6/ The  $V_{IH}$  and  $V_{IL}$  tests are not required if applied as forcing functions for  $V_{OH}$  and  $V_{OL}$  tests.
- 7/ The maximum limit for this parameter at 100 krads (Si) is 4  $\mu$ A.
- 8/ Power dissipation capacitance ( $C_{PD}$ ) determines both the power consumption ( $P_D$ ) and dynamic current consumption ( $I_S$ ). Where:
- $$P_D = (C_{PD} + C_L) (V_{CC} \times V_{CC})f + (I_{CC} \times V_{CC})$$
- $$I_S = (C_{PD} + C_L) V_{CC}f + I_{CC}$$
- f is the frequency of the input signal and  $C_L$  is the external output load capacitance.
- 9/ Tests shall be performed in sequence, attributes data only. Functional tests shall include the truth table and other logic patterns used for fault detection. The test vectors used to verify the truth table shall, at a minimum, test all functions of each input and output. All possible input to output logic patterns per function shall be guaranteed, if not tested, to the truth table in figure 2 herein. Functional tests shall be performed in sequence as approved by the qualifying activity on qualified devices. For  $V_{OUT}$  measurements,  $L \leq 0.3V_{CC}$  and  $H \geq 0.7V_{CC}$ .
- 10/ AC limits at  $V_{CC} = 5.5$  V are equal to the limits at  $V_{CC} = 4.5$  V and guaranteed by testing at  $V_{CC} = 4.5$  V. AC limits at  $V_{CC} = 3.6$  V are equal to limits at  $V_{CC} = 3.0$  V and guaranteed by testing at  $V_{CC} = 3.0$  V. Minimum ac limits for  $V_{CC} = 5.5$  V and  $V_{CC} = 3.6$  V shall be guaranteed to be no more than 0.5 ns less than those specified at  $V_{CC} = 4.5$  V and  $V_{CC} = 3.0$  V, respectively, in table IA herein. For propagation delay tests, all paths must be tested.
