## 4:1 High Speed Video Multiplexer

### General Description

The LMH™6574 is a high performance analog multiplexer optimized for professional grade video and other high fidelity high bandwidth analog applications. The output amplifier selects any one of four buffered input signals based on the state of the two address bits. The LMH6574 provides a 400 MHz bandwidth at 2 V<sub>PP</sub> output signal levels. Multimedia and high definition television (HDTV) applications can benefit from the LMH6574's 0.1 dB bandwidth of 150 MHz and its 2200 V/μs slew rate.

The LMH6574 supports composite video applications with its 0.02% and 0.05° differential gain and phase errors for NTSC and PAL video signals while driving a single, back terminated 75Ω load. An 80 mA linear output current is available for driving multiple video load applications.

The LMH6574 gain is set by external feedback and gain set resistors for maximum flexibility.

The LMH6574 is available in the 14 pin SOIC package.

### Features

- 500 MHz, 500 mV -3 dB bandwidth, A<sub>V</sub> = 2
- 400 MHz, 2V<sub>PP</sub> -3 dB bandwidth, A<sub>V</sub> = 2
- 8 ns channel switching time
- 70 dB channel to channel isolation @ 10 MHz
- 0.02%, 0.05° diff. gain, phase
- 0.1 dB gain flatness to 150 MHz
- 2200 V/μs slew rate
- Wide supply voltage range: 6V (±3V) to 12V (±6V)
- -68 dB HD2 @ 5 MHz
- -84 dB HD3 @ 5 MHz

### Applications

- Video router
- Multi input video monitor
- Instrumentation / Test equipment
- Receiver IF diversity switch
- Multi Channel A/D Driver
- Picture in Picture video switch

**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not guaranteed. For guaranteed specifications, see the Electrical Characteristics tables.

**Note 2:** Electrical Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that  $T_J = T_A$ . No guarantee of parametric performance is indicated in the electrical tables under conditions of internal self heating where  $T_J > T_A$ . See Applications Section for information on temperature de-rating of this device. Min/Max ratings are based on product testing, characterization and simulation. Individual parameters are tested as noted.

**Note 3:** The maximum output current ( $I_{OUT}$ ) is determined by the device power dissipation limitations (The junction temperature cannot be allowed to exceed 150°C). See the Power Dissipation section of the Application Section for more details. A short circuit condition should be limited to 5 seconds or less.

**Note 4:** Human Body model, 1.5 k $\Omega$  in series with 100 pF. Machine model, 0 $\Omega$  in series with 200 pF.

**Note 5:** Parameters guaranteed by electrical testing at 25°C.

**Note 6:** Parameters guaranteed by design.

**Note 7:** Positive Value is current into device.

# Application Notes

## GENERAL INFORMATION

20119722

FIGURE 1. Typical Application

The LMH6574 is a high-speed 4:1 analog multiplexer, optimized for very high speed and low distortion. With selectable gain and excellent AC performance, the LMH6574 is ideally suited for switching high resolution, presentation grade video signals. The LMH6574 has no internal ground reference. Single or split supply configurations are both possible. The LMH6574 features very high speed channel switching and disable times. When disabled the LMH6574 output is high impedance making MUX expansion possible by combining multiple devices. See “Multiplexer Expansion” section below.

### VIDEO PERFORMANCE

The LMH6574 has been designed to provide excellent performance with production quality video signals in a wide variety of formats such as HDTV and High Resolution VGA. Best performance will be obtained with back-terminated loads. The back termination reduces reflections from the transmission line and effectively masks transmission line and other parasitic capacitances from the amplifier output stage. *Figure 1* shows a typical configuration for driving a 75Ω. Cable. The output buffer is configured for a gain of 2, so using back terminated loads will give a net gain of 1.

### FEEDBACK RESISTOR SELECTION

20119732

FIGURE 2. Suggested R<sub>F</sub> vs. Gain

## Application Notes (Continued)

The LMH6574 has a current feedback output buffer with gain determined by external feedback ( $R_F$ ) and gain set ( $R_G$ ) resistors. With current feedback amplifiers, the closed loop frequency response is a function of  $R_F$ . For a gain of 2 V/V, the recommended value of  $R_F$  is 575 $\Omega$ . For other gains see the chart "Suggested  $R_F$  vs Gain". Generally, lowering  $R_F$  from the recommended value will peak the frequency response and extend the bandwidth while increasing the value of  $R_F$  will cause the frequency response to roll off faster. Reducing the value of  $R_F$  too far below the recommended value will cause overshoot, ringing and, eventually, oscillation.

Since all applications are slightly different it is worth some experimentation to find the optimal  $R_F$  for a given circuit. For more information see Application Note OA-13 which describes the relationship between  $R_F$  and closed-loop frequency response for current feedback operational amplifiers. The impedance looking into pin 12 is approximately 20 $\Omega$ . This allows for good bandwidth at gains up to 10 V/V. When used with gains over 10 V/V, the LMH6574 will exhibit a "gain bandwidth product" similar to a typical voltage feedback amplifier. For gains of over 10 V/V consider selecting a high performance video amplifier like the LMH6720 to provide additional gain.

### SD vs. $\overline{EN}$

The LMH6574 has both shutdown and disable capability. The shutdown feature affects the entire chip, whereas the

disable function only affects the output buffer. When in shutdown mode, minimal power is consumed. The shutdown function is very fast, but causes a very brief spike of about 400 mV to appear on the output. When in shutdown mode the LMH6574 consumes only 1.8 mA of supply current. For maximum input to output isolation use the shutdown function.

The  $\overline{EN}$  pin only disables the output buffer which results in a substantially reduced output glitch of only 50 mV. While disabled the chip consumes 4.7 mA, considerably more than when shutdown. This is because the input buffers are still active. For minimal output glitch use the  $\overline{EN}$  pin. Also, care should be taken to ensure that, while in the disabled state, the voltage differential between the active input buffer (the one selected by pins A0 and A1) and the output pin stays less than 2V. As the voltage differential increases, input to output isolation decreases. Normally this is not an issue. See the section on MULTIPLEXER EXPANSION for further details.

To reduce the output glitch when using the SD pin, switch the  $\overline{EN}$  pin at least 10 ns before switching the SD pin. This can be accomplished by using an RC delay circuit between the two pins if only one control signal is available.

Logic inputs "SD" and " $\overline{EN}$ " will revert to the "High", while "A<sub>0</sub>" and "A<sub>1</sub>" will revert to the "Low" state when left floating.

### MULTIPLEXER EXPANSION

Figure 3 shows an 8:1 MUX using two LMH6574's.

20119718

FIGURE 3. 8:1 MUX USING TWO LMH6574's

Application Notes (Continued)

FIGURE 4. Delay Circuit Implementation

If it is important in the end application to make sure that no two inputs are presented to the output at the same time, an optional delay block can be added, to drive the SHUTDOWN pin of each device. Figure 4 shows one possible approach to this delay circuit. The delay circuit shown will delay SHUTDOWN's H to L transitions ( $R_1$  and  $C_1$  decay) but won't delay its L to H transition.  $R_2$  should be kept small compared to  $R_1$  in order to not reduce the SHUTDOWN voltage and to produce little or no delay to SHUTDOWN.

With the SHUTDOWN pin putting the output stage into a high impedance state, several LMH6574's can be tied together to form a larger input MUX. However, there is a loading effect on the active output caused by the unselected devices. The circuit in Figure 5 shows how to compensate for this effect. For the 16:1 MUX function shown in Figure 5 below the gain error would be about  $-0.8$  dB, or about 9%. In the circuit in Figure 5, resistor ratios have been adjusted to compensate for this gain error. By adjusting the gain of each multiplexer circuit the error can be reduced to the tolerance of the resistors used (1% in this example).

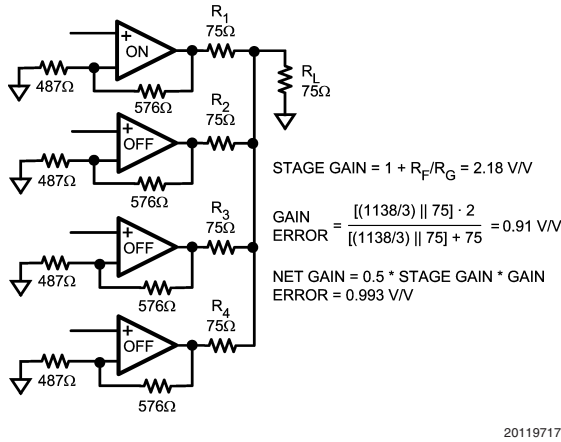

FIGURE 5. Multiplexer Gain Compensation

Disabling of the LMH6574 using the  $\overline{EN}$  pin is not recommended for use when doing multiplexer expansion. While disabled, If the voltage between the selected input and the chip output exceeds approximately 2V the device will begin to enter a soft breakdown state. This will show up as reduced input to output isolation. The signal on the non-inverting input of the output driver amplifier will leak through to the inverting input, and then to the output through the feedback resistor. The worst case is a gain of 1 configuration where the non inverting input follows the active input buffer and (through the feedback resistor) the inverting input follows the voltage driving the output stage. The solution for this is to use shutdown mode for multiplexer expansion.

Other Applications

The LMH6574 could support a multi antenna receiver with up to four separate antennas. Monitoring the signal strength of all 4 antennas and connecting the strongest signal to the final IF stage would provide effective spacial diversity.

For direction finding, the LMH6574 could be used to provide high speed sampling of four separate antennas to a single DSP which would use the information to calculate the direction of the received signal.

DRIVING CAPACITIVE LOADS

Capacitive output loading applications will benefit from the use of a series output resistor  $R_{OUT}$ . Figure 6 shows the use of a series output resistor,  $R_{OUT}$ , to stabilize the amplifier output under capacitive loading. Capacitive loads of 5 to 120 pF are the most critical, causing ringing, frequency response peaking and possible oscillation. The chart "Suggested  $R_{OUT}$  vs. Cap Load" gives a recommended value for selecting a series output resistor for mitigating capacitive loads. The values suggested in the charts are selected for 0.5 dB or less of peaking in the frequency response. This gives a good compromise between settling time and bandwidth. For applications where maximum frequency response is needed and some peaking is tolerable, the value of  $R_{OUT}$  can be reduced slightly from the recommended values.

FIGURE 6. Decoupling Capacitive Loads

FIGURE 7. Suggested  $R_{OUT}$  vs. Capacitive Load

## Other Applications (Continued)

20119714

**FIGURE 8. Frequency Response vs. Capacitive Load**

### LAYOUT CONSIDERATIONS

Whenever questions about layout arise, use the evaluation board as a guide. The LMH730276 is the evaluation board supplied with samples of the LMH6574. To reduce parasitic capacitances, ground and power planes should be removed near the input and output pins. For long signal paths controlled impedance lines should be used, along with impedance matching elements at both ends. Bypass capacitors should be placed as close to the device as possible. Bypass capacitors from each rail to ground are applied in pairs. The larger electrolytic bypass capacitors can be located farther from the device, the smaller ceramic capacitors should be placed as close to the device as possible. In *Figure 1*, the capacitor between  $V^+$  and  $V^-$  is optional, but is recommended for best second harmonic distortion. Another way to enhance performance is to use pairs of 0.01  $\mu\text{F}$  and 0.1  $\mu\text{F}$  ceramic capacitors for each supply bypass.

### POWER DISSIPATION

The LMH6574 is optimized for maximum speed and performance in the small form factor of the standard SOIC package. To ensure maximum output drive and highest performance, thermal shutdown is not provided. Therefore, it is of

utmost importance to make sure that the  $T_{\text{JMAX}}$  is never exceeded due to the overall power dissipation.

Follow these steps to determine the Maximum power dissipation for the LMH6574:

1. Calculate the quiescent (no-load) power:  $P_{\text{AMP}} = I_{\text{CC}} * (V_{\text{S}})$ , where  $V_{\text{S}} = V^+ - V^-$ .
2. Calculate the RMS power dissipated in the output stage:  $P_{\text{D}} (\text{rms}) = \text{rms} ((V_{\text{S}} - V_{\text{OUT}}) * I_{\text{OUT}})$ , where  $V_{\text{OUT}}$  and  $I_{\text{OUT}}$  are the voltage across and the current through the external load and  $V_{\text{S}}$  is the total supply voltage.
3. Calculate the total RMS power:  $P_{\text{T}} = P_{\text{AMP}} + P_{\text{D}}$ .

The maximum power that the LMH6574 package can dissipate at a given temperature can be derived with the following equation:

$P_{\text{MAX}} = (150^\circ - T_{\text{AMB}}) / \theta_{\text{JA}}$ , where  $T_{\text{AMB}}$  = Ambient temperature ( $^\circ\text{C}$ ) and  $\theta_{\text{JA}}$  = Thermal resistance, from junction to ambient, for a given package ( $^\circ\text{C}/\text{W}$ ). For the SOIC package  $\theta_{\text{JA}}$  is 130  $^\circ\text{C}/\text{W}$ .

### ESD PROTECTION

The LMH6574 is protected against electrostatic discharge (ESD) on all pins. The LMH6574 will survive 2000V Human Body model and 200V Machine model events. Under normal operation the ESD diodes have no effect on circuit performance. There are occasions, however, when the ESD diodes will be evident. If the LMH6574 is driven by a large signal while the device is powered down the ESD diodes will conduct. The current that flows through the ESD diodes will either exit the chip through the supply pins or will flow through the device, hence it is possible to power up a chip with a large signal applied to the input pins. Using the shutdown mode is one way to conserve power and still prevent unexpected operation.

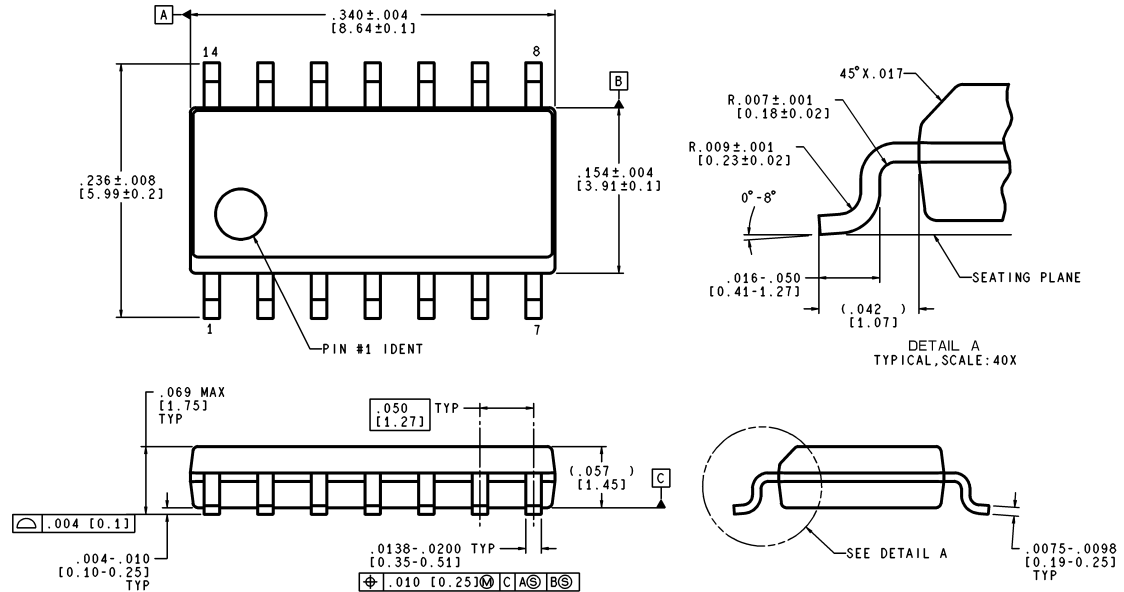

### EVALUATION BOARDS

National Semiconductor provides the following evaluation boards as a guide for high frequency layout and as an aid in device testing and characterization. Many of the data sheet plots were measured with this board.

Device	Package	Evaluation Board
LMH6574	SOIC	LMH730276

An evaluation board can be shipped when a sample request is placed with National Semiconductor. Samples can be ordered on the National web page. ([www.national.com](http://www.national.com))

National does not assume any responsibility for use of any circuitry described, no circuit patent licenses are implied and National reserves the right at any time without notice to change said circuitry and specifications.

For the most current product information visit us at [www.national.com](http://www.national.com).

#### LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

- Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
- A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

#### BANNED SUBSTANCE COMPLIANCE

National Semiconductor manufactures products and uses packing materials that meet the provisions of the Customer Products Stewardship Specification (CSP-9-111C2) and the Banned Substances and Materials of Interest Specification (CSP-9-111S2) and contain no "Banned Substances" as defined in CSP-9-111S2.

Leadfree products are RoHS compliant.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
