# FEATURES

- Improved immunity against HF and RF noise
- Height of 0.8 mm
- ± 75° half angle sensitivity
- Low supply current
- Photo detectors and preamplifier in one package
- Internal filter for PCM frequency
- Supply voltage: 2.5 V to 5.5 V, typically even 2.0 V to 5.5 V is possible
- Improved immunity against optical noise
- Insensitive to supply voltage ripple and noise
- Material categorization: for definitions of compliance please see <u>www.vishay.com/doc?99912</u>

# DESCRIPTION

The TSOP57... series are miniaturized SMD IR receiver modules for infrared remote control systems. A PIN diode and a preamplifier are assembled on a PCB, the epoxy package contains an IR filter.

The demodulated output signal can be directly connected to a microprocessor for decoding.

The TSOP574.. series devices are optimized to suppress almost all spurious pulses from Wi-Fi and CFL sources. They may suppress some data signals if continuously transmitted.

The TSOP572.. series devices are provided primarily for compatibility with old AGC2 designs. New designs should prefer the TSOP574.. series containing the newer AGC4.

These components have not been qualified according to automotive specifications.

## SUITABLE DATA FORMAT

The TSOP572.., TSOP574.. series is designed to suppress spurious output pulses due to noise or disturbance signals. The devices can distinguish data signals from noise due to differences in frequency, burst length, and envelope duty cycle. The data signal should be close to the device's band-pass center frequency (e.g. 38 kHz) and fulfill the conditions in the table below.

When a data signal is applied to the TSOP572.., TSOP574.. in the presence of a disturbance, the sensitivity of the receiver is automatically reduced by the AGC to insure that no spurious pulses are present at the receiver's output. Some examples which are suppressed are:

- DC light (e.g. from tungsten bulbs sunlight)
- · Continuous signals at any frequency
- Strongly or weakly modulated patterns from fluorescent lamps with electronic ballasts (see Fig. 13 or Fig. 14)
- 2.4 GHz and 5 GHz Wi-Fi

# **Vishay Semiconductors**

#### **Reflow Soldering**

- Reflow soldering must be done within 168 h while stored under a max. temperature of 30 °C, 60 % RH after opening the dry pack envelope
- Set the furnace temperatures for pre-heating and heating in accordance with the reflow temperature profile as shown in the diagram. Exercise extreme care to keep the maximum temperature below 260 °C. The temperature shown in the profile means the temperature at the device surface. Since there is a temperature difference between the component and the circuit board, it should be verified that the temperature of the device is accurately being measured
- Handling after reflow should be done only after the work surface has been cooled off

### VISHAY LEAD (Pb)-FREE REFLOW SOLDER PROFILE

#### Manual Soldering

- Use a soldering iron of 25 W or less. Adjust the temperature of the soldering iron below 300 °C
- Finish soldering within 3 s
- Handle products only after the temperature has cooled off

### LABEL

#### Standard bar code labels for finished goods

The standard bar code labels are product labels and used for identification of goods. The finished goods are packed in final packing area. The standard packing units are labeled with standard bar code labels before transported as finished goods to warehouses. The labels are on each packing unit and contain Vishay Semiconductor GmbH specific data.

### **DRY PACKING**

The reel is packed in an anti-humidity bag to protect the devices from absorbing moisture during transportation and storage.

# FINAL PACKING

The sealed reel is packed into a cardboard box.

### **RECOMMENDED METHOD OF STORAGE**

Dry box storage is recommended as soon as the aluminum bag has been opened to prevent moisture absorption. The following conditions should be observed, if dry boxes are not available:

- Storage temperature 10 °C to 30 °C
- Storage humidity  $\leq$  60 % RH max.

After more than 168 h under these conditions moisture content will be too high for reflow soldering.

In case of moisture absorption, the devices will recover to the former condition by drying under the following condition:

192 h at 40  $^{\circ}\text{C}$  + 5  $^{\circ}\text{C}$  / - 0  $^{\circ}\text{C}$  and < 5 % RH (dry air / nitrogen) or

96 h at 60  $^\circ\text{C}$  + 5  $^\circ\text{C}$  and < 5 % RH for all device containers or

24 h at 125 °C + 5 °C not suitable for reel or tubes.

An EIA JEDEC<sup>®</sup> standard J-STD-020 level 3 label is included on all dry bags.

Rev. 2.6, 26-Sep-2018

9

Caution

This bag contains MOISTURE-SENSITIVE DEVICES

3. After bag is opened, devices that will be subjected to reflow solder or other high

a) Humidity Indicator Card reads >10% for level 2a - 5a devices or  $>\!\!60\%$  for level 2 devices when read at  $23{\pm}5^{\circ}C$ 

5. If baking is required, refer to IPC/JEDEC J-STD-033 for bake procedure

a) Mounted within:  $\underbrace{168}_{lf \, blank, \, see \, adjacent \, bar \, code \, label}_{down C/60\% \, RH, \, or}$ 

1. Calculated shelf life in sealed bag: 12 months at  ${<}40^\circ C$  and  ${<}90\%$  relative humidity (RH)

2. Peak package body temperature:  $\frac{260}{_{\text{If blank, see adjacent bar}}}$ 

temperature process must be

b) Stored per J-STD-033
